Ferric Oxide

Binder Content Levels

- **H (High):** Heavy-duty cutting, high metal removal.
- **M (Medium):** Balanced cut and brightness, normal use.
- **L (Low):** Finishing compounds, high brightness, clean surface.

Technical Notes on Grit

The abrasive particles are measured by **sieve mesh size** rather than by grit. For the green compound, the mesh size is rated **-325**, meaning nothing is coarser than 325 grit. Particles can be as fine as **0.6 micron**, allowing ultra-fine polishing.

Other performance factors include hardness, porosity, oil absorption, melting point of binders, and abrasive-to-binder ratios. Generally, less binder content produces a higher luster finish, while higher binder content enhances cutting power and lubrication.

Usage Guide

1. Ensure the blade or tool edge is already sharpened with a whetstone or sharpener.
2. Apply a thin, even layer of the honing compound to a leather strop, cotton wheel, or felt pad.
3. For **hand stropping**: Lay the blade flat against the strop, lift the spine slightly, and draw the blade backward (edge trailing) in smooth strokes.
4. For **power honing**: Use on a wheel or belt at low to medium speed, avoiding overheating of the edge.
5. Repeat the process on both sides of the edge until a mirror polish and razor-sharp finish is achieved.
6. Clean the blade with a dry cloth after stropping.

When to Use Compound vs. Whetstones

Fallkniven offers a complete sharpening ecosystem:

- **DC4 Pocket Stone / DC521 Bench Stone:** Used for sharpening dull or damaged edges. The *diamond side* quickly reshapes the blade, while the *ceramic side* hones to a sharp finish.
- **Green Micro Fine Honing Compound:** Used after sharpening with DC4 or DC521. It polishes and refines the edge to a razor-sharp, mirror finish, ideal for precision cutting tasks and final edge maintenance.

ORDER CONFIRMATION

In short, **whetstones restore sharpness**, while the **honing compound perfects and maintains it**.

Glossary

- **Stropping:** Final polishing step to refine a sharpened edge, often with leather and honing compounds.
- **Chromium Oxide (Green Rouge):** A fine abrasive widely used for producing a mirror finish on edges.
- **Micron:** A unit of measurement equal to one-millionth of a meter, used to describe abrasive particle size.
